 Portfolio

PROFESSIONAL SUMMARY

Result Oriented Data Scientist having robust technical skills from extraction to actionable insights specializing in Python with Strong foundation in classical ML models (Regression, Classification) and experienced in model deployment preparation using tools like Jupyter and Git. Adept at leveraging advanced SQL for database interaction and utilizing Pandas/NumPy for high-volume data transformation. Seeking to deliver data-driven decision support and predictive insights.

EDUCATION

MBA - Data Science, , Manipal University Jaipur	08/2025 – Present
B.Tech - Computer Engineering, Swarnim Startup and Innovation University	08/2020 – 02/2025

SKILLS

Technical Skills

- Python
- Libraries (Pandas, Numpy, Seaborn, Matplotlib)
- SQL (MySQL)
- MS Office (Word, Excel)
- Statistics
- Power BI
- GIT
- Machine Learning (Regression , Classification)
- Neural Networks
- NLP

Soft Skills

- Communication Skills
- Data Storytelling
- Visual Communication
- Adaptability
- Lateral Thinking

LANGUAGES

English | Malayalam | Gujarati | Hindi

Courses

Certified Data Scientist By DataMites, DataMites	07/2025 – Present Ahmedabad
---	--------------------------------

PROJECTS

Flight Fare Prediction (Multiple Models)

- Engineered a predictive model to forecast airline ticket prices using a dataset of 10,000+ records, achieving a peak R2 score of 0.85 and reducing Mean Absolute Error (MAE) to ₹1,128.
- Identified and captured non-linear price volatility by pivoting from Linear Regression to XGBoost, effectively modeling exponential price spikes related to booking lead times and seasonal demand.
- Conducted strategic outlier analysis on premium fare segments; rather than removing extreme values

- Optimized model performance through feature engineering and hyperparameter tuning using RandomizedSearchCV.

Obesity Level Prediction

- Developed a multi-class classification system to predict obesity levels based on 17+ lifestyle and dietary features, utilizing a dataset of 2,100+ records.
- Implemented a Decision Tree Classifier, conducting hyperparameter tuning to achieve an optimal balance between model interpretability.
- Performed rigorous data preprocessing, including handling categorical encoding, feature scaling, and correlation analysis to identify key health drivers like physical activity and caloric intake.
- Built a web interface using Streamlit and successfully architected the deployment on Render

Bank Loan Eligibility Prediction (SVM)

- Designed an end-to-end ML pipeline in Python using Support Vector Machines to process raw applicant data, handling missing values through median imputation and categorical encoding for "Education" and "Property Area."
- Applied Label Encoding and Min-Max Scaling to ensure the SVM algorithm converged faster and more accurately during the training phase.
- Analyzed model performance using Confusion Matrices and ROC-AUC curves, ensuring the system maintained high precision across imbalanced classes.
